

Product overview

Electrics & Electronics

ELECTRONIC MADE FOR INDIVIDUAL CHALLENGES

Extensive expertise: The broad electronics portfolio from HELLA!

Whether on or off the motorway: there is a suitable technical solution for every requirement. In the field of special original equipment, HELLA offers a comprehensive electronics programme with components in the areas of sensors & actuators, automated driving, lighting and body electronics and energy management - always with the aim of developing this further. That is why HELLA continues to expand its electronics portfolio.

One thing always comes first: no matter how specific your requirements are, HELLA will find an individual solution for you. Our application specialists will also support you in integrating the most recent technologies and functions. The sales, product management and development departments are by your side with your electronics projects - flexibly and always with the technical support required within your product application.

INFORMATIVE, COMPACT, INTERACTIVE. Information about our electronics range.

Our online information is designed to let you reliably and conveniently identify the latest HELLA products and find out all the important details.

- Product information
- Product videos
- Animations
- Configuration tools for many applications
- Online catalogues

Here you will find everything you need to know about our electronics portfolio.
www.hella.com/soe

This brochure provides a glimpse into the HELLA electronics product range for on-highway and off-highway applications.

	Agricultural machinery		Construction vehicles
	Mining		Trucks and trailers
	City buses and coaches		Municipal vehicles and special vehicles
	Emergency vehicles		Motorhomes
	Motorbikes and quads		E-Mobility
	Some of our products are likewise also relevant for Tier X customers.		Premium Car Solutions
	Marine		Forklifts

THE ROCKER SWITCH CONFIGURATOR

Your dream switch in just a few steps! With the new rocker switch configurator, you can now put together your individual switch even more easily and in a clearer, more straightforward way!

With just a few clicks, choose between various criteria and accessories for the 3100 or 4100 series - it could not be more convenient!

www.hella.com/switch

THE ELECTRONICS TOOL: SPECIAL ORIGINAL EQUIPMENT

In the field of special original equipment, HELLA offers an extensive range of electronics products for a wide variety of applications.

Our electronics tool informs you quickly and clearly which electronic products HELLA offers for special original equipment.

First of all, select an appropriate vehicle or area of application (Tier X). After selecting the appropriate product by mouse click, you will receive further information including pdf files with important details and technical data for download. Furthermore, the tool provides clear animations showing how the products work.

IP stands for International Protection. The IP protection classes are determined according to DIN 40050, Part 9. The purpose of the standard is to precisely define resistance to the ingress of solid foreign bodies, including dust, and similarly resistance to the ingress of water. The adjacent overview of the IP protection classes and the explanations of their meaning are intended to serve as a help in selecting the right components so that these meet the relevant requirements of your application.

PROTECTION CLASSES AGAINST THE PENETRATION OF SOLID FOREIGN MATERIAL (DUST)			PROTECTION CLASSES AGAINST WATER INGRESS		
First digit	Brief description	Definition	Second digit	Brief description	Definition
0	Not protected	No requirements	0	Not protected	No requirements
1	Protected against solid foreign material > 50 mm	The object probe, a ball 50 mm in diameter, must not be able to penetrate completely	1	Protected against dripping water	Vertically falling drops are not to have any harmful effects
2	Protected against solid foreign material > 12.5 mm in diameter	The object probe, 12.5 mm in diameter, must not penetrate at all	2	Protection against dripping water when the housing is tilted by up to 15°	Vertically falling drops are to have no harmful effects if the housing is tilted at an angle of up to 15° on either side of the vertical
3	Protected against solid foreign material > 2.5 mm in diameter	The object probe, 2.5 mm in diameter, must not penetrate at all	3	Protected against spray	Water sprayed at an angle of up to 60° on either side of the vertical must have no harmful effects
4	Protected against solid foreign material > 1.0 mm in diameter	The object probe, 1.0 mm in diameter, must not penetrate at all	4	Protected against spray	Water sprayed or splashed against the housing from one direction must have no harmful effects
			4K	Protected against splash water at increased pressure	Water splashing against the housing from any direction at increased pressure must have no harmful effects
5K	Dust protected	The penetration of dust is not prevented completely, but dust must not penetrate to such an extent that the satisfactory operation of the device or its safety is affected	5	Protected against jets of water	Water directed as a jet against the housing from any direction must not have any harmful effects
6K	Dustproof	No ingress of dust	6	Protected against powerful jets of sprayed water	Water directed as a strong jet against the housing from any direction must not have any harmful effects
			6K	Protected against powerful jets of sprayed water under increased pressure	Water directed as a jet under increased pressure against the housing from any direction must not have any harmful effects
			7	Protected against the effects of temporary immersion in water	Water must not enter in quantities that would cause damaging effects if the housing is temporarily immersed in water under defined time and pressure conditions
			8	Exposure to water during continuous immersion	Ingress of water is not to occur in a quantity that would cause harmful effects if the housing is permanently immersed in water under defined conditions
			9	Protected against the effects of permanent immersion in water	Water must not seep in to the extent that it would cause damage if the housing is permanently immersed in water
			9K	Protected against water during high-pressure / steam jet cleaning	Water under greatly increased pressure directed against the housing from any direction must show no harmful effects

Angular position sensors

PRODUCT FEATURES

- High precision thanks to internal 14 bit resolution
- High temperature stability and linearity
- Highly insensitive to magnetic fields
- Zero position can be individually programmed
- Various connecting elements available
- Two-channel solutions possible for safety-critical applications

APPLICATION

These CIPOS® angular position sensors (Contactless Inductive Position Sensor) can be used in many different applications to return accurate and reliable angular measurements even in tough environmental conditions. Their insensitivity to magnetic fields and their high level of temperature stability in particular are the characteristic qualities of the CIPOS® technology used in all angular position sensors. Angles are measured inductively using a non-contact and, consequently, wear-free method. A high degree of measuring precision is therefore guaranteed throughout the sensor's entire lifetime.

The redundant sensors (double sensors) enable failure detection and thus provide a higher level of safety for the complete system.

DESIGN AND FUNCTION

Inside the laser-welded housing made of polyamide PA66, the lever arm torque above the rotor is determined via the induction method. An ASIC (Application Specific Integrated Circuit) calculates the rotor position precisely. Various installation positions are possible via the repetitive characteristic curve of the output signal path (depending on the sensor structure used). This increases the number of flexible application options for the sensor.

OUTPUT SIGNAL

ANALOGUE

At a supply voltage of 5 V DC, the measured angle is reflected through the ratio of the output voltage (U_{out}) to the operating voltage (U_s) (ratiometrically to the supply voltage). This signal is output via a high side driver (HSD). At a supply voltage of 9 V to 32 V (multi-voltage), the measured angle is reflected through a voltage of 0.5 V to 4.5 V.

CIRCUIT FOR RATIOMETRIC (10 % TO 90 %) OR FIXED VOLTAGE OUTPUT (0.5 - 4.5 V)

An external pull-down resistor is required for this variant. For a 5 V supply, 2.7 kΩ to 10 kΩ must be selected for example. The maximum output current of the analogue output should not exceed 2 mA. Since the high side driver (HSD) is used as an analogue output, the output voltage is set relative to the supply voltage.

PROGRAM OVERVIEW

Mechanical connection	Angle range	Supply voltage	Output signal	Zero position	Lever arm	Part number	PU*	Page
Double sensors								
Bush	- 30° to + 30°	5 V or 9-32 V	0.5-4.5 V ratiometric / absolute	0° / 120° / 240°	50 mm	6PD 009 583-001	-	12
Bush	- 54 to + 54°	5 V or 9-32 V	0.5-4.5 V ratiometric / absolute	0° / 120° / 240°	50 mm	6PD 009 583-011	-	14
Bush	- 54 to + 54°	5 V or 9-32 V	0.5-4.5 V ratiometric / absolute	0° / 120° / 240°	70 mm	6PD 009 580-017	-	16
Ball, top	- 54 to + 54°	5 V or 9-32 V	0.5-4.5 V ratiometric / absolute	0° / 120° / 240°	90 mm	6PD 009 584-017	-	18

* Packaging unit

Angular position sensors
 Double sensors (redundant angle measurement for safety-critical applications)
Part number 6PD 009 583-001

TECHNICAL DATA

Angle range	- 30° to + 30°
Mechanical angle range	Unlimited (full 360° rotation)
Supply voltage	5 V ± 10 % or 9 - 32 V
"Crossed Scale" output signal	
Power supply	U _s 5 V
	Output U _{out1} 0.5–4.5 V ratiometric
	Output U _{out2} 4.5–0.5 V ratiometric
Power supply	U _s 9–32 V
	Output U _{out1} 0.5–4.5 V
	Output U _{out2} 4.5–0.5 V
Resolution	0.06°
Linearity error including temperature drift	±0.3°
Current consumption	< 15 mA
Max. current (analogue output)	< 2 mA
Housing type	B
Zero position	0° / 120° / 240°
Lever arm	50 mm, bush
Degree of protection	IP 6K9K
Operating temperature	-40°C to +85°C
Lifetime	5 million cycles
Polarity reversal protection	None, mechanical protection only
Mating connector ¹⁾	1394416-1
Pin coating	Sn

¹⁾ This accessory is not included in the scope of delivery. Available from TE Connectivity.

PIN ASSIGNMENT

Power supply with 5 V DC²⁾
 Pin 1: 5 V DC sensor 2
 Pin 2: Output U_{out1} 0.5–4.5 V ratiometric
 Pin 3: Not assigned
 Pin 4: 5 V DC sensor 1
 Pin 5: Output U_{out2} 4.5–0.5 V ratiometric
 Pin 6: Not assigned
 Pin 7: Ground sensor 2
 Pin 8: Ground sensor 1

²⁾ The power supply (Pin 1 and Pin 4) and the ground supply (Pin 7 and Pin 8) can be bridged externally (e.g. in the mating connector) to reduce the number of cables.

Power supply with 9–32 V DC³⁾
 Pin 1: Bridge to Pin 4 (external)
 Pin 2: Output U_{out1} 0.5–4.5 V
 Pin 3: 9–32 V DC sensor 1 and 2
 Pin 4: Bridge to Pin 1 (external)
 Pin 5: Output U_{out2} 4.5–0.5 V
 Pin 6: Not assigned
 Pin 7: Ground sensor 2
 Pin 8: Ground sensor 1

³⁾ Pin 1 and Pin 4 must be bridged externally (e.g. in the mating connector). The ground supply lines (Pin 7 and Pin 8) can be bridged externally (e.g. in the mating connector) to reduce the number of cables.

TECHNICAL DRAWING

CHARACTERISTIC CURVE OF THE ANGULAR POSITION SENSOR

The characteristic curve of the angular position sensor repeats itself every 120°. This results in freedom for the mounting of the position shown but also to be staggered at a multiple of 120°. This will not affect the behaviour of the connected system in any way. The measuring angle range is 60°. If it is exceeded by up to 30°, the output signal remains limited to the measuring range final value. If exceeded further, the next section of the characteristic curve is applied. The resulting measuring ranges and zero positions can be seen on the graphic representation. The segments of the circle shown in grey represent the angle range that cannot be measured.

Ratiometric output signal U_{out1} with 5 V power supply

Output signal U_{out2} = 100% - U_{out1}/U_s [%] (opposite characteristic curves)

Absolute output signal U_{out1} with 9–32 V power supply

Output signal U_{out2} = 5 V - U_{out1} [V] (opposite curve)

Angular position sensors
 Double sensors (redundant angle measurement for safety-critical applications)

Housing type	B
Zero position	0° / 120° / 240°
Lever arm	90 mm, ball, top
Degree of protection	IP 6K9K
Operating temperature	- 40°C to + 85°C
Lifetime	5 million cycles
Polarity reversal protection	None, mechanical protection only
Mating connector ¹⁾	1394416-1
Pin coating	Sn

¹⁾ This accessory is not included in the scope of delivery. Available from TE Connectivity.

PIN ASSIGNMENT

Power supply with 5 V DC²⁾
 Pin 1: 5 V DC sensor 2
 Pin 2: Output U_{out1} 0.5–4.5 V ratiometric
 Pin 3: Not assigned
 Pin 4: 5 V DC sensor 1
 Pin 5: Output U_{out2} 4.5–0.5 V ratiometric
 Pin 6: Not assigned
 Pin 7: Ground sensor 2
 Pin 8: Ground sensor 1

²⁾ The power supply (Pin 1 and Pin 4) and the ground supply (Pin 7 and Pin 8) can be bridged externally (e.g. in the mating connector) to reduce the number of cables.

Power supply with 9–32 V DC³⁾
 Pin 1: Bridge to Pin 4 (external)
 Pin 2: Output U_{out1} 0.5–4.5 V
 Pin 3: 9–32 V DC sensor 1 and 2
 Pin 4: Bridge to Pin 1 (external)
 Pin 5: Output U_{out2} 4.5–0.5 V
 Pin 6: Not assigned
 Pin 7: Ground sensor 2
 Pin 8: Ground sensor 1

³⁾ Pin 1 and Pin 4 must be bridged externally (e.g. in the mating connector). The ground supply lines (Pin 7 and Pin 8) can be bridged externally (e.g. in the mating connector) to reduce the number of cables.

TECHNICAL DRAWING

CHARACTERISTIC CURVE OF THE ANGULAR POSITION SENSOR

The characteristic curve of the angular position sensor repeats itself every 120°. This results in freedom for the mounting of the sensor, which enables it to be placed not only in the position shown but also to be staggered at a multiple of 120°. This will not affect the behaviour of the connected system in any way. The measuring angle range is 108°. If it is exceeded by up to 6°, the output signal remains limited to the measuring range final value. If exceeded further, the next section of the characteristic curve is applied. The resulting measuring ranges and zero positions can be seen on the graphic representation. The segments of the circle shown in grey represent the angle range that cannot be measured.

Ratiometric output signal U_{out1} with 5 V power supply

Output signal U_{out2} = 100% - U_{out1}/U_s [%] (opposite characteristic curves)

Absolute output signal U_{out1} with 9 to 32 V power supply

Output signal U_{out2} = 5 V - U_{out1} [V] (opposite curve)

* Packaging unit

Level sensors
Recording the liquid level
(static and dynamic)

PRODUCT FEATURES

- Fourth generation level sensors: Revision in terms of design and function
- Particularly high robustness against interference (environmental and media compatibility).
- The external temperature element reacts with an improved response time
- Continuous measurement of the engine oil level in the static and dynamic range
- Compact sensor architecture with a multi-chip module
- Immediate measurement after switch-on

APPLICATION

Oil sensors in vehicles ensure that the engine does not run with insufficient oil without such a situation being noticed. The tried-and-tested technology of ultrasonic sensors works on the run-time principle and records the fill level continuously when the vehicle is being driven. When the engine is running (dynamic measuring range), the fill level is significantly lower than the fill level when the engine is at a standstill (static measuring range). In mobile engines, an oil dipstick measures the oil level only in the static range. This oil level sensor can measure the oil level continuously, i.e. in both the dynamic and also the static range. Thus information is provided about the oil level during the entire engine operation, a process which can often last several hours in construction vehicles, tractors and forklifts.

The sensor continuously monitors the oil level during the entire operation of the engine. This function ensures that the oil level does not fall below the required minimum during engine operation, thus preventing the oil film from breaking down (which would result in engine damage). Another advantage of the sensor is the integrated temperature sensor, which provides an input variable for the thermal management of the engine.

Marginal influences, such as vehicle leaning, lateral and longitudinal accelerations, are compensated by averaging out in the vehicle's control unit.

Using the oil level sensor for measuring special media, e.g. transmission and hydraulic oils, requires prior inspection and approval by HELLA.

DESIGN AND FUNCTION

The sensor architecture of the PULS (Packed Ultrasonic Level Sensor) oil level sensor consists of one single multi-chip module that integrates the ultrasonic sensor, the temperature sensor and also an ASIC (Application Specific Integrated Circuit). This compactness gives the sensors a higher level of impact and vibration resistance than those sensors fitted with a large number of electronic components. The ultrasonic sensor integrated in the multi-chip module emits a signal that is reflected by the engine oil/air interface.

The time of the signal is measured and the height is calculated in line with the sound velocity in the medium. The damping cup installed above the multi-chip module is designed "to calm" the medium, (especially) in the dynamic measuring range. The damping cup has openings at the base and at the tip, which allow the oil to flow permanently.

INSTALLATION

The sensor is designed to be vertically flush-mounted from below into the bottom of an oil pan. Usually the oil level sensor is located on a ledge in the oil pan in order to protect the sensor base. This installation position, combined with the openings which make a permanent flow of oil possible, prevents sludge from forming within the damping cup.

SCHEMATIC DIAGRAM

Optimal sensor position: Central positioning in the oil pan for dynamic measurement

CONVERSION FORMULAS IN THE CONTROL UNIT

$$\text{Temp}_{\text{comp}} [^{\circ}\text{C}] = 3.125 \frac{\text{K}}{\text{ms}} \cdot \left(T_1 \cdot \frac{110 \text{ ms}}{T[\text{ms}]} - 23 \text{ ms} \right) - 40 \text{ K}$$

or

$$\text{Temp}_{\text{comp}} [^{\circ}\text{C}] = \frac{100}{32} \frac{\text{K}}{\text{ms}} \cdot \left(T_1 \cdot \frac{110 \text{ ms}}{T[\text{ms}]} - 23 \text{ ms} \right) - 40 \text{ K}$$

$$\text{diagnostic}[\text{ms}] = T_3[\text{ms}]$$

$$\text{Level}_{\text{comp}} [\text{mm}] = 2.3125 \frac{\text{mm}}{\text{ms}} \cdot \frac{T[\text{ms}]}{110 \text{ ms}} \cdot \left(T_2[\text{ms}] \cdot \frac{110 \text{ ms}}{T[\text{ms}]} - 23 \text{ ms} \right)$$

or

$$\text{Level}_{\text{comp}} [\text{mm}] = 2.3125 \frac{\text{mm}}{\text{ms}} \cdot \left(T_2[\text{ms}] - 23 \text{ ms} \cdot \frac{T[\text{ms}]}{110 \text{ ms}} \right)$$

or

$$\text{Level}_{\text{comp}} [\text{mm}] = \frac{74}{32} \frac{\text{mm}}{\text{ms}} \cdot \left(T_2[\text{ms}] - 23 \text{ ms} \cdot \frac{T[\text{ms}]}{110 \text{ ms}} \right)$$

OUTPUT CHARACTERISTICS

The minimum pull-up voltage of the sensor depends on the low-level threshold value stored in the control unit and also on a potential ground offset. It can be calculated using the following formula:

Name	Symbol	Min.	Typical	Max.	Unit	Remarks
Output voltage, low	V _{ol}	-	-	0.0375 x V _{pullup} + 1 V	V	The required ground displacement of 1 V must be taken into account for dimensioning of the low level threshold
Output voltage, high ¹⁾	V _{oh}	V _{pullup} - 0.5 V	-	-	V	Open circuit with output capacity = 1nF (Under external capacitive load, please observe the slew rate)
Pull-up voltage	V _{pullup}	-	-	16	V	The minimum voltage results from the ECU; high/low limit values in consideration of output voltages at PIN 1 (signal)
Output current at low level	I _{ol}	-	-	10	mA	For V _{ol} > 0.0375 x V _{pullup} + 1 V
Output current at high level	I _{oh}	-50	0	50	μA	For GND < V _{oh} < V _{pullup}
PWM open collector resistor ²⁾	R _{pullup}	1.6	-	10	kOhm	To be implemented in the engine control unit
Capacitive load ³⁾	C _{load}	-	-	50	nF	
Output current - short-circuit detection	I _{ol_SHORT}	65	-	-	mA	

¹⁾ Open collector with output capacitance = 1nF (with external capacitive load, please observe slew rate).
²⁾ To be implemented in the on-board computer.
³⁾ Capacitive load at pulse communication output.

STARTUP BEHAVIOUR AFTER POWER ON

PWM (OPEN COLLECTOR) SIGNAL EVALUATION

The PWM output signal consists of three pulses that are repeated cyclically every 1,000 ms ± 10%. The pulses contain coded information about the oil temperature, oil level and diagnosis.

Viscosities	1 mm ² /s to 1,300 mm ² /s

¹⁾ Dependent on damping cup length (see variant overview)
²⁾ Level output over -10 °C. At temperatures below -10 °C, an "empty" signal is sent (18 mm) together with the diagnostic signal "out of tolerance".
³⁾ This accessory is not included in the scope of delivery. Available from Hirschmann.

NEW GENERATION SENSOR

This sensor has an improved meander structure for optimised behaviour under dynamic conditions in oil and it also has improved response times.

Tolerance of level measurement

Oil level	Temperature range	Operating voltage	Tolerance
13 mm to L-6 mm	-10 °C ≤ T < 30 °C	9–16 V	±4 mm
13 mm to L-6 mm	30 °C ≤ T < 150 °C	9–16 V	+2 mm

Temperature measurement tolerance

Oil level	Temperature range	Operating voltage	Tolerance
All	60 °C ≤ T < 120 °C	6–16 V	±2 K

PIN ASSIGNMENT/ELECTRICAL CONNECTION

Pin 1: OUTPUT
Pin 2: TML 31 GND
Pin 3: KL 15 U_{BAT}

TECHNICAL DRAWING

DYNAMIC MEASUREMENT OF THE ENGINE OIL LEVEL

For dynamic measurement (while the engine is running), an evaluation algorithm in the control unit must be developed, which compensates for the marginal influences of the engine (oil volume, oil temperature, speed) and of the vehicle (longitudinal and lateral acceleration, uphill and downhill motion). As a result of subsequent averaging, the influences brought about by driving conditions cancel themselves out over longer periods of time. Hence, either a warning can be triggered with respect to the minimum oil volume reached or the oil volume that is actually still available can be calculated.

Level sensors
Measuring oil pressure and oil temperature

PRODUCT FEATURES

- Continuous measurement of the oil pressure
- Continuous measurement of the oil temperature
- Robust and reliable design

DESIGN AND FUNCTION

The OPS+T is based on a multi-chip module (MCM) consisting of a piezoresistive cell for measuring absolute pressure and also of an ASIC for digital evaluation and further processing of the information. In addition, the oil temperature can be established using a diode which is integrated in the MCM. Both the oil pressure and also the oil temperature are transmitted via the PWM output signal. The engine control unit (ECU) evaluates the PWM output signal of the sensor. The patented technology guarantees protection against oil leakage.

APPLICATION

The oil pressure and temperature sensor OPS+T is used to measure the absolute oil pressure and the oil temperature directly in the main oil channel behind the oil filter.

It uses the pressure value to carry out demand-responsive control of mechanical or electrical oil pumps. This lowers the CO₂ emissions and reduces fuel consumption. Recording of the temperature serves as input data for the thermal management of the engine. Both signals are evaluated in the higher-level control unit.

Using the multi-chip module means the sensor can be utilised in harsh environments.

EXTERNAL CIRCUITRY IN THE CONTROL UNIT

A 10 kΩ pull-up resistor should be integrated in the ECU of the vehicle in order to define an idle mode.

For optimum reading of the PWM signal, a capacitance of max. 2.2 nF should be integrated so as to compensate for the oscillations.

PROGRAM OVERVIEW

Mounting	Supply voltage	Measuring range	Part number	PU*

TOLERANCE BAND FOR TEMPERATURE MEASUREMENT

Temperature	Accuracy
135 °C to 160 °C	± 1 K
20 °C to 135 °C	± 2 K
-40°C to 20 °C	± 3 K

OUTPUT SIGNAL

A pulse width modulated signal (PWM) is used to provide temperature, pressure and diagnostic information. All the information is sent every 9,216 µs. The higher-level control unit must be able to measure the different pulse widths of the three square wave signals, which can vary from 128 µs to 3,958 µs. The control unit must provide a suitable sampling frequency and logic for measuring and recording the signals.

General information on the evaluation of PWM communication:
Because of the adjustment accuracy of the oscillator and its temperature dependence, the length of a PWM frame is subject to a maximum tolerance of ± 10 %. Serious hardware errors in the program sequence of the ASIC cancel the PWM communication and are then detectable by the control unit on account of a permanent high level.

S₁: Signal
T₁: Temperature
T₂: Pressure

S₁: DIAGNOSTIC SIGNAL

DC = 0.25 (S₁ = 256 µs ± 25 µs) => OPS functional state
DC = 0.375 (S₁ = 384 µs ± 25 µs) => pressure failure
DC = 0.5 (S₁ = 512 µs ± 25 µs) => temperature failure
DC = 0.625 (S₁ = 640 µs ± 25 µs) => hardware failure

T₁: TEMPERATURE EVALUATION

96.9 % of the PWM block duration T1 (3968 µs) corresponds to the uppermost point of the measuring range of 160°C.
3.1 % of the PWM block duration T1 (128 µs) corresponds to the lowest point of the measuring range of -40°C.

$$T_{1|\mu s} = 19.2 \frac{\mu s}{^\circ C} \cdot \text{Temp} + 896 \mu s$$

T₂: PRESSURE EVALUATION(T₂ LEVEL)

96.9 % of the PWM block duration T2 (3968 µs) corresponds to the uppermost point of the measuring range of 10.5 bar.
3.1 % of the PWM block duration T2 (128 µs) corresponds to the lowest point of the measuring range of 0.5 bar.

$$T_{2|\mu s} = 384 \frac{\mu s}{\text{bar}} \cdot \text{Pressure} - 64 \mu s$$

ECU CALCULATION

$$\text{Temperature} = \left(\frac{4096 \mu s}{T_{P1,adj \mu s}} \cdot T_{1|\mu s} - 128 \mu s \right) \cdot \frac{1}{19.2} \frac{^\circ C}{\mu s} - 40 \text{ } ^\circ C$$

$$\text{Pressure} = \left(\frac{4096 \mu s}{T_{P1,adj \mu s}} \cdot T_{2|\mu s} - 128 \mu s \right) \cdot \frac{1}{384} \frac{\text{bar}}{\mu s} + 0.5 \text{ bar}$$

$$\text{Diagnostics} = \left(\frac{1024 \mu s}{T_{P1,adj \mu s}} \cdot S_{1|\mu s} \right)$$

Particulate matter sensor PM 2.5
for particles 0.3 µm to 5 µm
On request

PRODUCT FEATURES

- Monitors and controls the concentration of particulate matter precisely
- Based on the optical principle of scattered light for particle detection
- Fast response time of < 5 seconds enables reaction to environmental conditions to take place in real time

APPLICATION

The particulate matter sensor was developed for monitoring and measuring the quality of indoor air (in the cabin) and that of supply air. Particulate matter is one of the most dangerous pollutants for the human body. Because of their small size, the particles can penetrate deep into the lungs. Over longer periods of time, they can cause lung diseases such as bronchitis or asthma and even contribute towards cardiovascular disease. With the PM 2.5 sensor, long-term damage to health caused by air pollution can be reduced if the sensor in the vehicle is used to bring about extended air recirculation.

DESIGN AND FUNCTION

The PM 2.5 sensor is integrated into the ventilation control system. Because of its compact design, the sensor can usually be placed in the same spot as where the air is to be sucked in. A cover cap is sufficient to prevent coarse dirt and water from entering the sensor. If the air is to be drawn in elsewhere, hoses for supply and exhaust air must be laid there. The organising of such hoses can either be arranged by the customer or provided by HELLA following the relevant consultation.

The PM 2.5 sensor detects and counts fine dust particles using light scattering: When air flows through the detection chamber, the particles pass a laser beam that is scattered by them. The scattered light is received by a diode and converted into an electrical signal which is used to calculate the particle concentration.

The calculated values are transmitted to the vehicle via a LIN interface and thus signal to the air conditioning system to switch, for example, to air recirculation mode before larger quantities of particulate matter can enter the vehicle.

If two sensors are used, both the indoor and outdoor air quality can be monitored. This provides the user with additional benefits such as an automatic air recirculation function or a demand-oriented display of a filter service as required.

These measures help to significantly improve air quality in the vehicle interior and to reduce the health consequences of exposure to particulate matter. As a welcome side effect, vehicle operating costs can be reduced because the intervals at which filters are changed become significantly longer.

TECHNICAL DATA	
Voltage	12 V

Rain-light sensors
Recording environmental properties

PRODUCT FEATURES

- The fourth generation in a long established line of rain sensors from HELLA
- Five functions in one product: Rain, light, solar and moisture measurements and also adjustment of the light intensity on the head-up display
- Optimised design – extremely compact package space

APPLICATION

The rain-light sensors (RLS) are used in a variety of vehicles, primarily for automatic rain or light control.

These features reduce the driver's workload by virtually eliminating the need for the driver to react and manually operate the wiper lever in rain or the light switch in darkness (tunnels, garages, twilight).

With sensors for passenger cars, it is also possible to integrate the solar and humidity detection functions so as to link them to an automatic climate control system. Furthermore, the sensor can be equipped with an optional head-up display function.

HELLA offers a variety of sensors that are optimally tailored to suit individual vehicle makes. Installation conditions and the characteristics of the windscreen to which the sensors are to be attached are always tested very individually and in close collaboration with the vehicle manufacturer.

HELLA views the lighting function of the RLS as safety-relevant in accordance with ISO 26262.

DESIGN AND FUNCTION

This new sensor offers the user five functions in one product:

Rain sensor

The rain sensor is used to recognise different rain conditions in the sensor area and then to activate the windscreen wipers accordingly. Driver intervention is virtually no longer necessary.

Light sensor

As a light sensor, it controls the switching on and off of the low beam in various lighting conditions or in special situations, e.g. when driving through tunnels.

Head-Up-Display

When used for the head-up display, the sensor records the brightness immediately in front of the vehicle and adjusts the light intensity on the display in line with the prevailing lighting conditions.

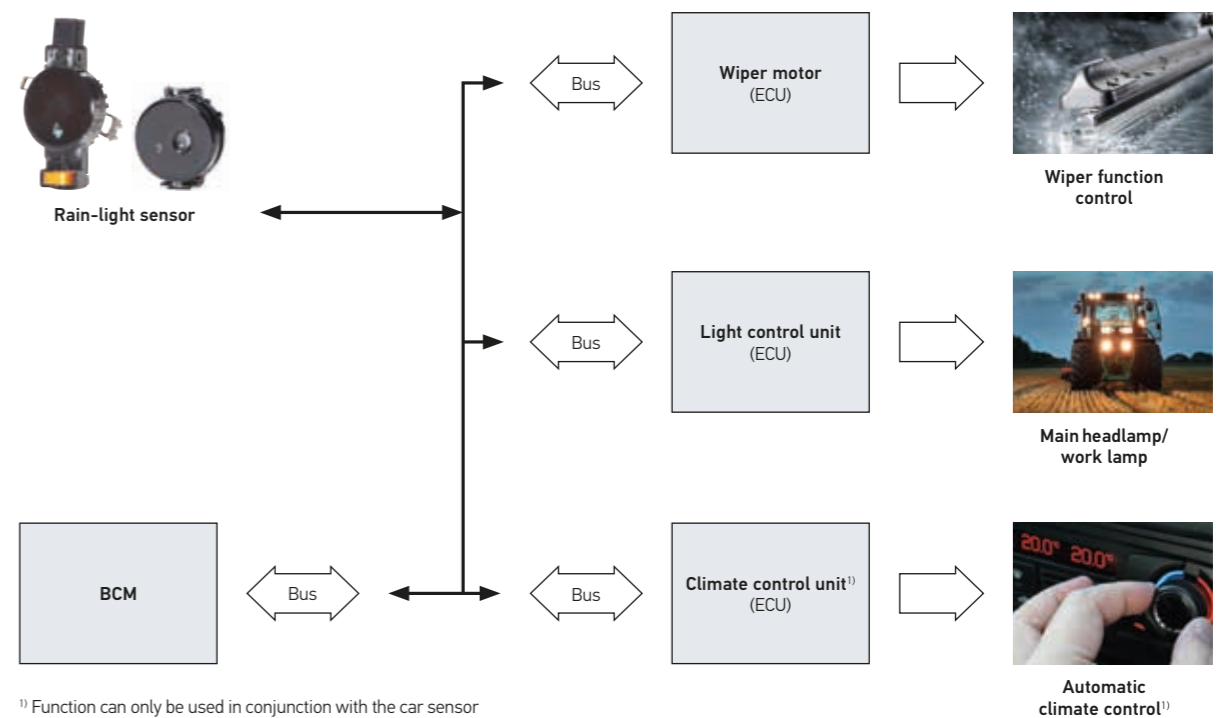

Solar sensor

As a solar sensor, it measures insolation levels, which supports the climate control system.

Humidity measurement

Humidity measurement is used to control the air conditioning control unit serving the air conditioning in the vehicle interior, which includes tasks such as automatic ventilation of the windscreen.

FUNCTIONAL DIAGRAM

PROGRAM OVERVIEW

The sensors have to be specially adapted to suit each vehicle type. Consequently all part numbers are assigned on a manufacturer-specific basis.

Floor-mounted accelerator pedals

Floor-mounted accelerator pedals
On request

PRODUCT FEATURES

- Contactless measuring principle
- Slim yet sturdy design
- Simple mechanical connection
- Redundant output signal
- High measurement accuracy
- No programming/teaching in the vehicle necessary
- High interference immunity against electrical and magnetic fields

DESIGN AND FUNCTION

The housing and pedal plate are made entirely from recyclable glass-fibre reinforced plastic. The actuating force is generated by two springs, each individually ensuring safe return to the original position. The electrical output signal is obtained via the CIPOS® measuring principle. For this purpose, a sheet metal cursor is routed from the pedal plate with a guide rod via sensor conductor paths on the measuring board. Two galvanically isolated sensors then each generate an output signal there.

APPLICATION

HELLA accelerator pedals designed for upright or pendant mounting can be used in a wide variety of vehicles – ranging from automotive sector applications, such as sports cars and electric vehicles, to robust applications in agricultural and construction vehicles. Thanks to the contactless system of measurement provided by HELLA's own CIPOS® sensor (see description of construction and function) and its extremely low level of mechanical wear, it is advisable to choose such a sensor system over contact-type accelerator pedals, especially for small, frequently recurring movements.

TECHNICAL DATA

Operating voltage	5 V ± 6 %
Power consumption per channel	max. 10 mA
Overvoltage protection, duration t = 60 min	16 V
Initial force	15.5 N
Final force	31 N
Actuation angle	15°
Output signal	2 x analogue ratiometric, 2nd channel half pitch
Linearity	≤ 1 %
Synchronisation	≤ 1.2 %
Idling voltage	16 % / 8 %
Full throttle voltage	79 % / 39 %
Load resistance	10 kΩ to 225 kΩ
Load capacity	max. 15 nF
Filter constant in control unit	1 ms ± 5 %
Signal output current	max. 0.525 mA
Operating temperature	-40°C to +85 °C
Storage temperature	-40°C to +105 °C
Protection class (electronics)	IP 5K4
Housing material	PP-GF30
Mating connector ¹⁾	F(6189-1083)
Weight	≤ 500 g
Actuations	min. 2 million
EMV	CISPR 25, class 5, electric and magnetic fields
ESD	2 kV, 12 kV ²⁾

¹⁾ This accessory is not included in the scope of delivery. Available from Sumitomo. Gold-plated contacts and single conductor insulation are required.
²⁾ With ESD-protected connector and wiring

PRODUCT FEATURES

- Contactless measurement
- Slim yet sturdy design
- Simple mechanical connection
- Redundant output signal
- High measurement accuracy
- No programming/teaching in the vehicle necessary
- High interference immunity against electrical and magnetic fields

DESIGN AND FUNCTION

Housing and operating lever are completely made of recyclable, glass-fibre reinforced plastic. The actuating force is generated by two springs, each individually ensuring safe return to the original position. The electrical output signal is obtained via the CIPOS® measuring principle. For this purpose, a sheet metal cursor is routed from the pedal arm via sensor paths on the measuring board. An output signal is generated by two galvanically isolated sensors there. Different output signals can be generated depending on the measuring board used.

In addition, individual characteristic curves can be programmed on request.

Road condition sensor (RCS/ SHAKE)

PRODUCT FEATURES

- Detects wetness on roads reliably and at an early stage both day and night
- Enables warning to be given on wet roads in order to prevent aquaplaning
- Input variable for friction coefficient calculation in brake and control systems
- Robust measuring principle of airborne and structure-borne sound analysis in the wheel arch, tried-and-tested over many years

APPLICATION

The road condition sensor (RCS) is a sensor capable of providing an input variable (the wetness) for driver assistance systems.

If the sensor is positioned in the wheel arch (application-specific on each front wheel arch cover), it measures the amount of water pooling on the road. This information can then be made available to the driver or to the appropriate systems in order to alert them to a possible risk of aquaplaning. In this way, driving behaviour can be adapted so as to avoid causing accidents.

By measuring the road wetness at a constant driving speed, the RCS provides an extension to the dynamic friction value calculation (e.g. for ABS or ESP).

Depending on customer requirements, different vehicle reactions can be triggered whenever road moisture is detected:

- Warning given to driver when level of moisture on road speed becomes critical
- Prediction of braking distance depending on road wetness
- Adjusting distance from the vehicle ahead on wet roads (ACC)
- Influence on control systems of longitudinal and transverse dynamics

DESIGN AND FUNCTION

When road moisture occurs, the sensor detects vibrations and noises from water swirling around in the area of the wheel arch. Specific algorithms free the signal from disturbance variables and calculate the water film height.

The signal is processed by the embedded electronics and software of the sensor and sent via a LIN interface (bidirectional) to the vehicle control unit (ECU). Details on the sensor communication can be customised. The RCS sensor can contribute to better driving stability by lowering, for example, the activation thresholds for ABS and traction control. The sensor signals can also be used to adjust the drive train control in order to ensure stability during acceleration – especially when cornering.

If the road condition sensor is used for partially or highly automated driving, the information about the degree of wetness can also be used to dynamically adjust the distance to the vehicle in front.

In order to fix the sensor to the wheel arch cover, the sensor housing is connected to a bracket. This can either be injected directly into the wheel arch by the manufacturer or alternatively a special, separate fastening element can be used.

The sensor is mechanically robust against:

- Dirt/dust
- Ice/ice build-up
- Stones/impact of objects
- Distortion of the wheel arch liner during driving (dynamic and fast)

TECHNICAL DATA

Operating voltage	9-16 V
Operating temperature	-40°C to +90 °C
Current consumption	approx. 20 mA at 12 V
Degree of protection	IP 6K9K
V _{max}	180 km/h ¹⁾
Minimum detection limit (road wetness)	250 µm
Interface	LIN 2.1
Mating connector ²⁾	Hirschmann 872-858-541 or TE Connectivity 1-1670917-1
Weight	< 30 g

¹⁾ The wetness detection has been validated by HELLA up to a speed of 180 km/h. Beyond this, wet roads pose a risk to life and limb and the responsibility lies with the customer. Dryness detection functions up to a speed of 300 km/h.
²⁾ These accessories are not included in the scope of delivery. Available from Hirschmann Automotive or TE Connectivity.

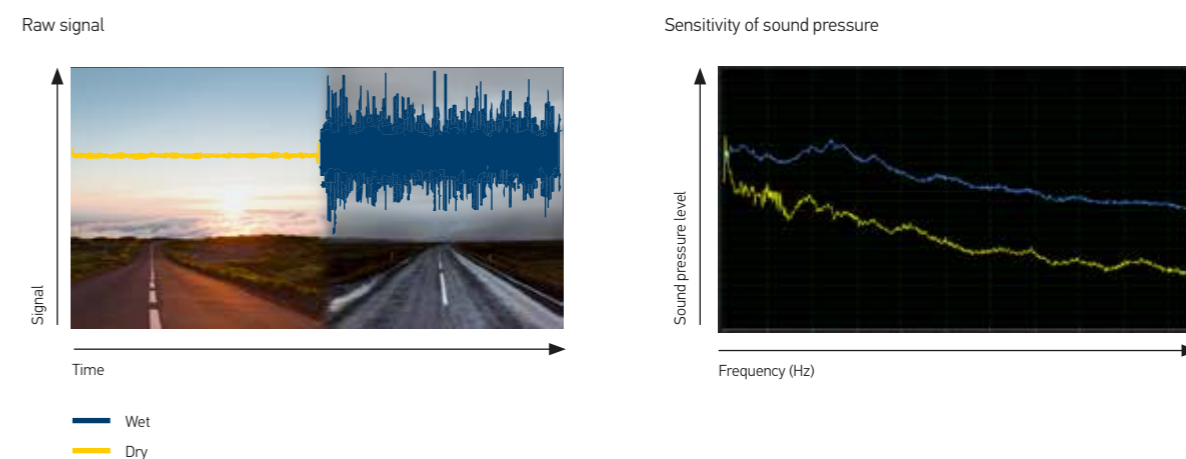

TECHNICAL DRAWING

PIN ASSIGNMENT/ELECTRICAL CONNECTION

FUNCTIONAL PRINCIPLE/STRUCTURE-BORNE SOUND RECOGNITION

MOUNTING IN THE WHEEL ARCH

The road condition sensor (RCS) may only be connected directly to the wheel arch via the bracket and the decoupling element. A clearance of 10 mm to adjacent components must be guaranteed.

MOUNTING OPENING

Example showing cross section of the wheel arch through hole

Optimal positioning of the SHAKE sensor in the wheel arch

Linear actuators
Electrical locking/unlocking and closing

PRODUCT FEATURES

- High actuating force
- High-accuracy laser-welded housing
- Three functioning variants
- Dustproof or waterproof
- With or without manual adjustment
- Thermal overload protection through PTC (PolySwitch)
- Multi-purpose usage
- Various connecting elements available

DESIGN AND FUNCTION

There is an electric motor installed in the two laser-welded polyamide housing halves. As a result of the electric motor being supplied with current via pin 1 and pin 2, it moves a spindle gear, which causes the tappet to retract or extend depending on the direction of rotation. The current supply with plus at pin 1 and minus at pin 2 causes the tappet to extend.

The current supply with minus at pin 1 and plus at pin 2, causes the tappet to retract. The stability of the retracted/extended locking positions is achieved by the short-circuited motor following successful actuation. A PolySwitch (PTC) integrated in the motor provides thermal overload protection. In addition, it is possible to equip the actuators with an automatic return function (retracting or extending) by way of a mainspring.

ACCESSORIES

The comprehensive range of accessories for the linear actuator includes a wide variety of different connecting elements. These allow the straightforward integration of the actuator in the application without additional development expenditure being necessary.

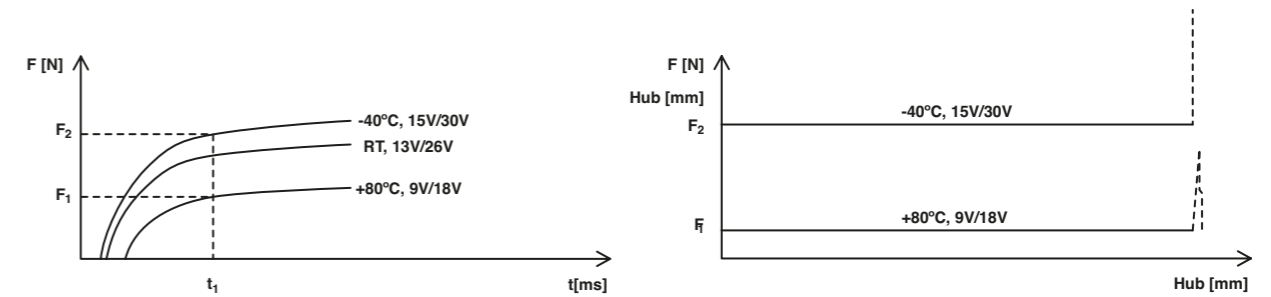

APPLICATION

The linear actuator is used for the electrical locking, unlocking or closing function of the closing and flap systems in automotive and industrial applications.

Examples of applications in mechanisms include:

- Electrical locking/unlocking
- Electrical closing
- Electrical opening and closing of all doors (locking systems), flaps, sunroofs, seats, covers, bonnets, glove compartments, etc.

DEPENDENCIES OF ACTUATING FORCE – CHARACTERISTIC CURVES

With a controller time of t_1 , the actuator has an actuating force of $F_1 < F < F_2$. The constant actuating force on the tappet over the rated stroke depends on the operating voltage and ambient temperature. If the actuator has no load to move over the stroke, the actuator power is converted into a higher actuator speed, resulting in the dynamic impact pulse becoming a multiple of the constant actuating force.

Rotatory actuators for high forces
Electrical locking/unlocking and closing

PRODUCT FEATURES

- Very high positioning forces
- Robust and compact design
- Interference suppression Class 3
- Universal interface for Bowden cable
- For universal use

DESIGN AND FUNCTION

This electromotive actuator is driven by a DC motor with rotary output. The actuator is operated by applying a voltage via a 2-pin connector with the contacts "+" and "Ground". It is reset by simply reversing the polarity or, alternatively, automatically via a spring. Direction of rotation and running time are defined by the control unit. The actuator can be attached to three connection points.

APPLICATION REQUIREMENTS:

The actuator is not to be mechanically limited or restricted in any way by the application. The high impact pulse (approx. 7 – 8 Nm) can damage the application, the bracket or the Bowden cable.

The customer application must ensure that, in the rest position, (end position following anti-clockwise rotation) no load is applied to the actuator in order to avoid damaging the internal limit stop.

During the mainspring reset (only 6NW 009 424-781), a motor short circuit is absolutely necessary. This short circuit takes place using a 1N 4005 diode during the lifetime test. The short-circuited motor has a braking effect that protects the internal limit stop. Without such protection, the dynamism in the system can damage the limit stop during the return action, which in turn can cause the device to become blocked.

APPLICATION

The actuator is particularly suitable for locking and closing applications where High Forces are required.

Examples include:

- Large locks and
- Large flaps
- Seat release

Where a Bowden cable is used, the actuator can also work without being attached to the vehicle body, since it is fixed to the application by means of the Bowden cable sleeve. The actuator can be embedded in a foam body for the purpose of noise insulation.

PIN ASSIGNMENT/ELECTRICAL CONNECTION

Rotatory actuators for low forces
Electrical locking/unlocking,
space-saving, with or without micro switch

PRODUCT FEATURES

- Compact, space-saving design
- Electromotive reset or automatic (non-electric) reset
- Easy installation with snap-fit mounting
- Splash-proof
- With or without micro switch
- Explosion report for tank modules

APPLICATION

The extremely space-saving design of this actuator makes it especially suitable for locking and unlocking applications in dry and wet areas (also via remote control, for example) where there is only very little space available.

Examples include:

- Tank modules
- Service flaps
- Glove compartments
- Locking of charging plugs (e-mobility)

DESIGN AND FUNCTION

When a voltage is applied, the motor integrated in the electromotive actuator moves the locking lever attached to the motor shaft.

There are two product variants available in the product range. The first variant of the actuator with electrical locking and unlocking function is particularly suitable for traditional applications, where the locking lever locks a hinged arm attached to the locking system by applying a voltage and then unlocks it by reversing the voltage polarity. The stability of the open/closed locking positions is achieved by the motor being short-circuited following successful triggering. The position of the locking element can also be defined via an integrated micro switch.

The second actuator variant has a return spring and a micro switch integrated. The micro switch is actuated by a slight movement of the locking lever, e.g. by pressing a service flap. Current is then applied to the actuator via a control unit. This makes the actuator locking lever retract completely, leaving the closing system open and triggering the spring-loaded opening of the service flap. The actuator is then switched off and the integrated return spring causes the locking lever to return to the locking position without the use of any current. In order to lock the service flap, this flap is pushed closed, at which point the hinged arm of the service flap snaps into the actuator's locking lever.

PROGRAM OVERVIEW

SWITCHING PROCESS FUNCTION SEQUENCE

Detection time "OPEN"

Description:
 Minimum period of time that the operator has to hold the operating element depressed for opening to take place.

Explanation:
 In order that short pulses do not lead to unintentional opening, the "Open" detection time starts when the status changes from [0], operating element not depressed, to [1], operating element depressed. If the state [1] "Switch active" is detected for longer than the preset value, opening is initiated when the status changes from [1] to [0].

Dead time

Description:
 Time between switch change to [0] and activation of the motor control [1] when an opening process is initiated.

Explanation:
 On the electronic side, there is a system reaction time comprising switch debouncing and the system runtime. This can result in a delay of up to 70 ms, which then extends the non-parametrisable (actual) dead time of the opening process.

Detection time "CLOSED"

Description:
 Minimum time that the application has to be closed before a new opening process can be initiated by the operator.

Explanation:
 When the application is open, the switch signal is active [1]. As soon as the operator closes the application, the switch signal changes to inactive [0]. The "CLOSED" detection time starts to run when the switch is set to inactive [0]. Two instances are possible when closing (see case studies).

Case studies

Case 1:
 The operator does not press down to the end stop when closing the application. The signal changes from "Switch active" [1] to "Switch not active" [0] and the detection time "CLOSED" starts. As soon as the preset time has expired, the application can be reopened.

Case 2:
 When closing the application, the operator presses down to the end stop. This means that the signal first changes from "Switch active" [1] to "Switch active" [0] and the "CLOSED" detection time starts. When the operator presses down again to the end stop, the signal changes back to "Switch active" [1] and the detection time "CLOSED" which has not yet expired is reset. As soon as the operator releases the application, the signal changes to "Switch not active" [0] and the "CLOSED" detection time starts again.

Intelligent, rotatory actuators for 360° angles
 Electrical locking/unlocking and closing
 Electrical rotation left, right,
 with high torque
 Position feedback using CIPOS® technology

PRODUCT FEATURES

- Actuator controls the position of its output gear according to the set position
- Precise position control using HELLA CIPOS® technology
- Electrical rotation (right/left) with high torque
- Flexible operating angle range with up to eight full rotations
- "True power on" function for angle ranges < 180°
- Integrated electronics monitor actuator function
- Error message and memory
- Self-blocking transmission

DESIGN AND FUNCTION

The intelligent, rotatory actuators for 360° angles monitor the position of the output gear and the integrated electronics continuously calculate the position using an ASIC (Application Specific Integrated Circuit). The actuator boasts the "True power on" function for angles under 180°, i.e. it enables direct startup without calibration. When in operation, the actuator carries out controlled movement to the programmable soft stops. The self-blocking transmission minimises current consumption (< 25 mA), which is required in order to maintain a defined position.

APPLICATION

The intelligent, rotatory actuators for 360° angles can be used in a wide range of applications involving harsh environmental conditions and can make precise and reliable positionings. The CIPOS® technology used in the intelligent, rotatory actuators for 360° angles is characterised in particular by its insensitivity to magnetic fields and also by its high temperature stability. Angles are measured inductively using a non-contact and consequently wear-free method, thus guaranteeing high measurement accuracy throughout the entire lifetime. An error memory records errors and the actuator is able to react differently and appropriately to all manner of errors.

APPLICATION EXAMPLES

- Seed metering/singling
- Control of supply air/exhaust air flaps
- Control of valves in a cooling circuit
- Control of air flaps of radiator grille

COOLING CIRCUITS IN DIFFERENT VEHICLE SEGMENTS

The intelligent, rotatory actuator for 360° angles controls the coolant valve, supporting the variable flow of coolant by regulating the heat quantities particularly precisely.

TECHNICAL DRAWING

PIN ASSIGNMENT/ELECTRICAL CONNECTION

PWM INTERFACE – INPUT SIGNAL

A PWM signal can be used as an input signal for communication between the actuator and the control unit. This PWM signal has to be provided by the external control unit as a low side driver (open collector). The PWM input signal is defined by the period duration and by the duty cycle. The period duration begins (and ends) with a rising edge. The duty cycle is defined as the ratio between the time with a high signal and the total period duration.

PWM FEEDBACK AND PWM GROUNDING

So as to transmit errors via PWM grounding, the PWM input signal is set to "Low" for a defined time and then reset again to "High". The time during which the PWM signal is set to "Low" depends on the error group.

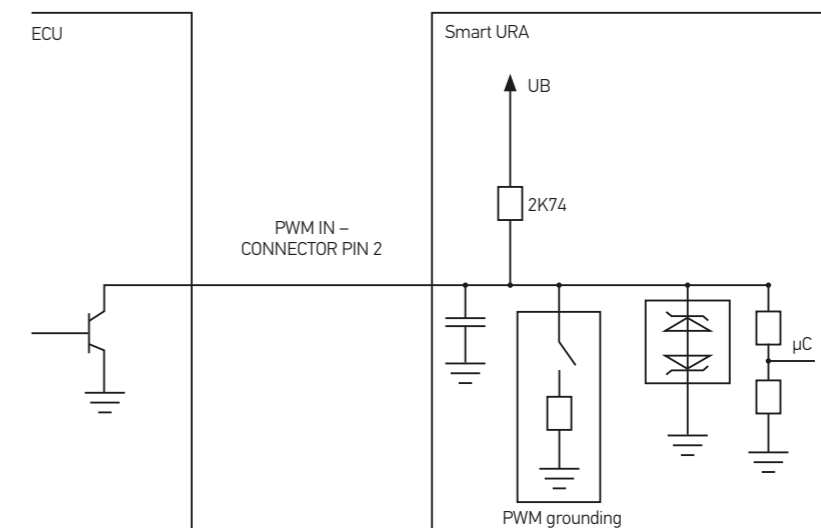

LIN INTERFACE/LIN BUS SPECIFICATIONS:

A LIN signal coming from the control unit can be used as an input/output signal for communication with the actuator. The Smart URA functions here as a LIN slave. The Smart URA works with the LIN 2.0 protocol without a diagnostic function (diagnostic function with 2.1 or 2.2 is possible). The hardware is compatible with the LIN 2.2 protocol. The typical baud rate is 19.2 kbps (± 10%).

PWM SIGNAL: DEFINITION

INTERFACE CIRCUIT PWM-INPUT

Intelligent, rotatory actuators for high temperatures

PRODUCT FEATURES

- Integrated electronics consisting of CIPOS® (Contactless Inductive Position Sensor) position sensor, motor control and error diagnosis
- Short response time
- Self-blocking transmission and low current consumption in order to hold position

DESIGN AND FUNCTION

The main function of the intelligent, rotatory actuator for high temperatures is to bring the shaft into the position specified by the control unit. With the aid of the CIPOS® sensor, the position of the shaft is continuously calculated and actively reported back. In addition to the CIPOS® sensor responsible for precise positioning, the integrated electronics include motor control and error diagnosis. In this way, errors can be detected, reported back and appropriate reactions automatically derived from them. The error messages are stored in a memory.

APPLICATION

The intelligent, rotatory actuator for high temperatures is mainly used for the VNT /VTG (Variable Nozzle Turbine/Variable Turbine Geometry) turbocharger technology so as to provide reliable and precise positioning. The CIPOS® technology used in the intelligent, rotatory actuators for high temperatures is characterised in particular by its insensitivity to magnetic fields and also by its high temperature stability. Angles are measured inductively using a non-contact and consequently wear-free method, thus guaranteeing high measurement accuracy throughout the entire lifetime.

TECHNICAL DATA

EXAMPLE OF A CONNECTING ELEMENT

PIN ASSIGNMENT/ELECTRICAL CONNECTION

Rotatory actuator for high temperatures
On request

PRODUCT FEATURES

- Integrated electronics consisting of CIPOS® (Contactless Inductive Position Sensor) position sensor, motor control and error diagnosis
- Spur gear, adapted to the exhaust gas pressure characteristics
- High measurement accuracy

DESIGN AND FUNCTION

The main function of the rotatory actuator for high temperatures is to control a valve that regulates the flow of exhaust gas to the turbine and allows reliable and precise positioning. In other words, it regulates the boost pressure to create a wider power spectrum, eliminate turbo lag and protect the engine and turbocharger. What distinguishes the CIPOS® technology used with the actuator is its particular insensitivity to magnetic fields and high level of temperature stability. Positions are measured inductively using a non-contact and consequently wear-free method, which guarantees high measurement accuracy throughout the entire lifetime.

APPLICATION

The rotatory actuator for high temperatures is used to operate the flap of the boost pressure control valve of turbocharged petrol engines.

If the waste gate flap is closed, the boost pressure increases. In the lower speed range, this leads to the turbocharger supplying the boost pressure or the corresponding air volume that is required for a high torque. The actuators are used in turbochargers to improve fuel efficiency.

Vacuum pumps

PRODUCT FEATURES

- Electrical vacuum pumps for the support or for the sole generating of the vacuum for the pneumatic brake booster system
- Applicable for all engine concepts, also for electric motors and hybrid drives
- HELLA is market leader and has more than 10 years of experience in the development and manufacture of electric vacuum pumps

DESIGN AND FUNCTION

The vacuum pumps' function is based on the rotary vane compressor principle. The pump contains a rotor that is off-centre to the pump chamber. The blades set in the rotor slide along the interior wall of the pump chamber.

The volume enclosed by the blades is continuously compressed by rotation. This change in the chamber volume causes a vacuum with the effect that air is sucked in by the brake booster through the vacuum pump via the brake system's pneumatic line system.

APPLICATION

Under certain driving conditions or depending on the engine layout, no vacuum or an insufficient vacuum is supplied to the brake booster through the intake manifold of an internal combustion engine. The UP 28 variant can support the system by generating an additional vacuum (Support application). The UP 5.0 can provide the pneumatic vacuum supply alone (Stand-alone application). In this way, the pump acts as the sole vacuum source and ensures an adequate supply for the brake booster and for any other auxiliary equipment.

Accessories: Pressure sensor with non-return valve	6PP 233 518-011/-017	1 / 72	88 / 89

* Packaging unit

Vacuum pump UP 28
8TG 008 570-021 / -027 (with relay box)
8TG 009 428-081 / -087 (with engine compartment connector)

TECHNICAL DATA

- Rotor and pump chamber eccentrically fixed
- 5-vane technology
- **Typical of support applications**

Rated voltage	13.5 V
Average current consumption between the threshold values	< 10 A
Lifetime	600 h
Maximum vacuum	86 % (≥ 88 % typical)
50 % of ambient pressure	≤ 5.5 s
70 % of ambient pressure	≤ 11 s
Booster size	3.2 l
Operating temperature	-40°C to +100 °C
Noise level	< 70 db(A)
Degree of protection	IP 6K9K
Mating connector UP 28 with relay box ¹⁾	09 4016-30
Mating connector for UP 28 with engine compartment connector ²⁾	2.8, 7283-5575-10

¹⁾ These accessories are not included in the scope of delivery. Available from Kostal.
²⁾ These accessories are not included in the scope of delivery. Available from Yazaki.

ACCESSORIES

Variant	Part number	PU*
Pressure sensor with non-return valve		
This pressure sensor is used for measuring the vacuum. It is suitable for applications such as monitoring the brake booster's vacuum circuit. It can be integrated directly into the vacuum line.	6PP 233 518-011 / -017	1 / 72

* Packaging unit

Vacuum pump UP 5.0
8TG 012 377-701 / -707 (with engine compartment connector)

TECHNICAL DATA

- Rotor with 8 vanes, optimised shape of pump chamber
- Plastic silencer with specific shape for noise level improvement
- **Typical of stand-alone applications**

Rated voltage	13 V
Average current consumption between the threshold values	16 A
Lifetime	1,500 h
Maximum vacuum	≥ 90 %
50 % of ambient pressure	≤ 3.0 s
70 % of ambient pressure	≤ 6.0 s
Booster size	5 l
Operating temperature	-40°C to +120 °C
Sound pressure level	< 73 db(A)
Degree of protection	IP 6K9K
Mating connector ¹⁾	Sealed: 7282-5575-10 With cable seal: 7158-3113-40 With coupling: 7117-4152-02

¹⁾ This accessory is not included in the scope of delivery. Available from Yazaki.

Acoustic vehicle alerting system (AVAS)

PRODUCT FEATURES

- For all-electric vehicles (PEV), hybrid electric vehicles (HEV) and fuel cell vehicles (FCV) with a silent engine for the purpose of improving road user safety
- Simulates simple engine noise
- Space-saving and compact loudspeaker
- Low power consumption

DESIGN AND FUNCTION

The AVAS pedestrian alerting system essentially consists of a signalling device and electronics. The AVAS pedestrian alerting system and the vehicle communicate via CAN bus. In this way, the AVAS system receives information from the vehicle about the vehicle speed and the gear position. As a result, the tone frequency and volume of the simulated engine noise are raised with increasing speed (when starting) and reduced accordingly with decreasing speed. The simulated engine noise is generated when the vehicle is driving forwards and backwards. From a speed of 20 or 30 km/h (country-specific), the rolling noise of the tyres drowns out the actual engine sound, disabling the function of the AVAS.

APPLICATION

Installing an acoustic alerting system has been mandatory for all newly developed electric and hybrid cars in the European Union since July 2019. And since July 2021, all newly registered electric models must be equipped with an acoustic vehicle alerting system. The sound limit for vehicles in the EU has been set at 20 km/h. In the USA, the threshold value is 30km/h. Below this level, cars have to produce sounds that resemble an internal combustion engine. When driving faster than this speed, the rolling noise produced by the tyres on the road is sufficient for the vehicle to be perceived by other road users.

CUSTOMER BENEFITS

Vehicles can normally be recognised acoustically in road traffic by the sound of their engines. However, electrically powered vehicles emit more or less no sound. This makes them dangerous for pedestrians, blind people, cyclists and other road users. Our acoustic alerting system has therefore been developed for e-vehicles and generates a sound based on an internal combustion engine noise.

APPLICATION EXAMPLES

Standard sound. Customer-specific sounds are available on request.

TECHNICAL DATA	
Operating voltage	9–16 V
Current consumption	150 mA (normal state), Idle current 100 µA
Weight	350 g
Operating temperature	-40°C to +85 °C
CAN	Diagnostics (based on UDS standard)
Loudspeaker	2 inch (Impedance 4 Ω)
Mute function	Support for On/Off status via CAN
Frequency range	160 Hz–5 kHz
Sound pressure level	65 ± 5 dB at 1 m distance Generation 0–30 km/h (N. N.) Minimum frequency shift speed: 0.8% (km/h)
Vehicle speed	2 to 20 km/h
Degree of protection	IP 6K9K
Digital amplifier	32 bits sampled at max 96 kHz
Housing volume	0.4 l
Housing material	PBT-GF15
Thermal overload protection	Yes
Connector	TYCO 114-18063-126
Mating connector ¹⁾	TYCO 1-967616-1

¹⁾ This accessory is not included in the scope of delivery. Available from Tyco Electronics.

TECHNICAL DATA CAN BUS INTERFACE ¹⁾	
CAN Specification	High speed automotive CAN
CAN baud rate	500 kbps
Diagnostics	according to UDS standard

¹⁾ The HELLA AVAS has CAN communication as standard. A DBC file can be provided. Customer-specific adaptations can be implemented on a project-specific basis in consultation with HELLA.

Compatibility to higher level protocols such as SAE J1939 on request.

Electromechanical horns

PRODUCT FEATURES

- Optimal tonal pattern achieved when a high and low tone horn set is installed
- Compact size and lightweight
- Variants with high supply voltage range available
- Variants with additional interference suppression available

DESIGN AND FUNCTION

Horns are powered by battery current, which is normally controlled by the steering wheel via a control current. This is directed to a relay, which transmits the entire control current so that no voltage drops occur.

The control current activates the solenoid in the horn and generates a magnetic field that attracts a metal core (armature) to which the horn's steel diaphragm is attached. In an attracted state, the power supply is interrupted, the magnetic field breaks down, the armature and diaphragm move back to the rest position and the power supply is re-established. The process then begins again. This causes an oscillation, which can be heard as a low or high sound.

APPLICATION

Horns are a mandatory part of the safety equipment of every vehicle.

A particularly perceptible signal is necessary so that other road users can be warned effectively in dangerous situations. Our signal horns offer you a high level of functional reliability.

PROGRAM OVERVIEW

Variants	Part number	PU*	Page	
Heavy Tone horn DL50 V2 Ideal for commercial vehicles, 2nd generation optimised horn; riveted				
12 V, 310 Hz, low tone, 6.3 mm flat connector	3CA 004 811-001	1	94

Electronic horns

PRODUCT FEATURES

- Durable horns in innovative technology
- Compact size and lightweight
- Multi-voltage horn available in the range
- No mechanical wear thanks to electronic design

DESIGN AND FUNCTION

Signal horns are powered by battery current, which is normally controlled by a switching current, which is, in turn, controlled by the steering wheel. This is sent to a relay, which ensures a uniform power supply for the horn.

As soon as there is supply voltage at the horn's solenoid, its armature is attracted together with the diaphragm. The power supply is triggered cyclically, meaning that there is an audible oscillation: the signal.

If the horn is electronic, the oscillation is, of course, generated via the electronics. That is the reason why an electronic horn is much more trouble-free than a classic horn, where the oscillation is generated by mechanically controlling the solenoid.

APPLICATION

Horns are required by law for motor vehicles and are part of the safety equipment of a vehicle.

A particularly clearly perceptible sound is necessary in order to be able to warn other road users effectively in dangerous situations.

Our signal horns offer you a high level of functional reliability.

77 GHz radar sensor

PRODUCT FEATURES

- Compact radar sensor developed for the most demanding environments IP 6K7 and IP X9K
- Wide field of view and long range
- Stable measuring signal even in adverse environmental conditions and when sensor cap is contaminated
- Fast measurements and response to change of position

DESIGN AND FUNCTION

The sensor is based on the frequency-modulated continuous wave method (FMCW). This means the frequency of a carrier frequency that is continuously emitted by the sensor is varied within a small range (the bandwidth). As soon as the signal is reflected back from an object to the sensor, the distance and speed of the detected object can be determined by comparing the frequency.

The centrepiece of the sensors is the radar system chip, which is based on RF-CMOS technology. The architecture makes it possible to integrate digital components and systems for self-diagnosis on one radar system chip, in addition to the components for transmitting and receiving.

APPLICATION

Radar sensors are becoming increasingly important in on-highway and off-highway applications. Such sensors enable a 360° environment detection around the vehicle both of moving objects (such as cars, cyclists and pedestrians) and also of stationary objects.

Thanks to FMCW radar (frequency modulated continuous wave radar), these 77 GHz sensors detect objects even under extreme weather conditions: Neither rain, snow, fog nor extreme temperatures affect their function.

The compact sensor design opens up new integration options, for example in the side of the vehicle. In addition to measuring the distance away from an object, its relative velocity can also be measured.

APPLICATION EXAMPLES:

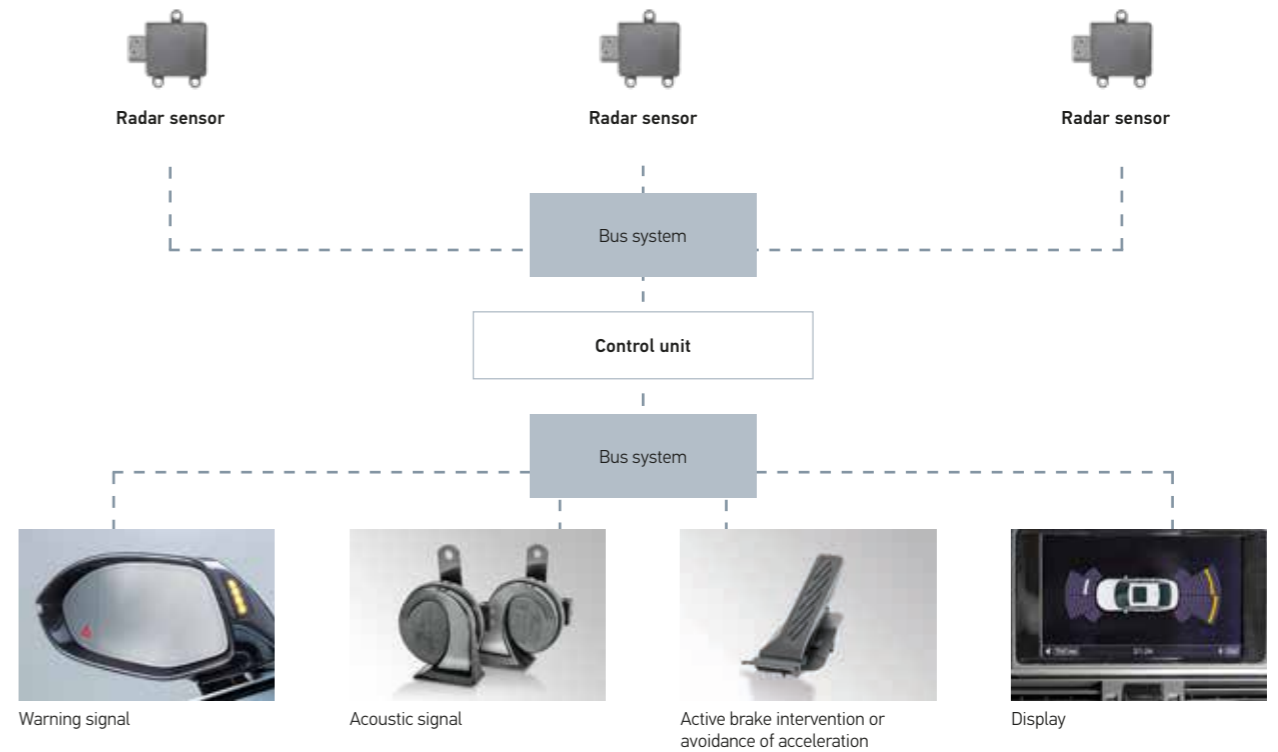

Vehicle rear end

- Pre-crash scenario before rear-end collision of an approaching vehicle
- Lane change assistant
- Warning of rear cross traffic, of moving objects or of stationary objects when reversing
- Safe exit assistant in uncertain situations
- Detection of objects located in the blind spot

Vehicle front

- Warning of cross traffic in the vicinity of crossroads
- Warning of cross traffic when manoeuvring out
- Detection of objects located in the blind spot
- Early detection of slower vehicles up ahead
- Maintaining a certain distance from the vehicle driving in front

POSSIBLE AREAS OF APPLICATION

REAR

LCA – Lane Change Assistant

Lane Change Assist – Detects and warns of approaching vehicles remotely

RCP – Rear Crash Detection

Detects a collision situation and prepares the active safety systems

RCTA – RearCross Traffic Alert

Warning of rear cross traffic, of moving objects or of stationary objects when reversing

ESTA – Exit Assistant

Safe exit assistant in uncertain situations

BSD – Blind Spot Detection

Detection of objects located in the blind spot

FRONT

BSD – Blind Spot Detection

Detection of objects located in the blind spot

FCTA – Front Cross Traffic Alert

Warning of cross traffic in the vicinity of crossroads and when leaving a parking space

FCW – Forward Collision Warning

Early detection of slower vehicles up ahead

Relays and relay devices

PRODUCT RANGE

- Mini relays (normally open and changeover relays)
- Micro relay (normally open/changeover relay)
- High power relay (normally open relay)
- Flasher units
- Washing/wiping interval control units
- Time control units

Relays are used in automotive engineering to switch high currents. The engine control unit, for example, is switched by a relay. Because relays are robust and not particularly susceptible to failure, they can be installed near electric consumers. They only require low control currents for switching, making small line cross-sections sufficient.

The switching and amplifier function of a relay could only be achieved with a lot more effort and a lot less reliability using more "modern" electronics. Another advantage of the relay: You can replace it quickly and easily. These many positive characteristics are the reason why relays are still in use. And they ensure that relays will continue to be at home in many vehicles in the future.

HELLA quality relays have many uses and are always reliable this is what our long-standing original equipment experience and our great production expertise stand for. Renowned automotive manufacturers have been relying on the trusted HELLA quality for decades.

→ Manufacturing expertise:

HELLA produces more than 100 million units each year in-house – thanks to optimised production at an attractive price and with one of the lowest failure rates in the entire industry.

→ Flexibility:

At HELLA, large volumes are produced fully automatically, smaller volumes semi-automatically. This allows a quick changeover in semi-automatic operation. HELLA is able to react to customer wishes in the shortest possible time and to realise new variants promptly in addition to the existing product range.

→ Original equipment customers:

HELLA develops and produces relays, for example for AGCO, Claas, Daimler, Ford, VW, GM, JCB, Opel, Nissan, John Deere, Chrysler, Jaguar/Land Rover, BMW, Audi, Volvo, Renault, PSA, BYD and FAW. Many of our customer relationships have existed for decades.

PRODUCTS AND APPLICATIONS

Brochure – Relays and relay units
You can find the entire range in the specific brochure here as a PDF download.

**LED lighting:
Failure control and electrical connection**

In the ECE R48 area of application, it is necessary by law to ensure failure control of LED lamps/LED headlamps in the vehicle's electrical system using suitable measures. The driver must be made aware of the failure visually or acoustically in the vehicle.

HELLA recommends, as the best solution, detecting the electrical pulse directly in the car manufacturer's vehicle electrical system. It is merely necessary to integrate the check according to ISO 13207-1. This means that you no longer have to rely on interim solutions using direction indicator control units.

FUNCTIONAL DIAGRAM

All HELLA LED direction indicators with integrated electronics for failure control run checks on themselves and generate a single pulse. This pulse is evaluated by the electronic ballasts. The ballasts simulate a 21 W bulb. This makes operation with conventional flasher units possible.

In the event of a defect in the lamp, which can occur even if a single LED fails, the above-mentioned impulse is not generated. The ballasts switch off the bulb simulation and the flasher unit reports the defect to the driver. By measuring the lamp current during the time window of 10 ms, a direct comparison between the HELLA LED lamp and a bulb version is possible.

If the vehicle manufacturer does not provide direction indicator failure control via the vehicle electrical system, HELLA offers the following solutions:

HELLA provides electronic ballasts that make it possible to display the direction indicator failure for various vehicle assemblies and modifications.

This is necessary if the vehicle manufacturer does not guarantee direction indicator failure control via the vehicle's electrical system:

Vehicle manufacturers' light control units are able to check the failure pulse in a standardised and unified manner in accordance with ISO 13207-1.

Therefore interim solutions 1 – 3 will not be necessary since communication takes place directly with the direction indicator lamps. HELLA recommends this solution.

(Since trailers do not currently have their own vehicle electrical system, this solution must be integrated in the towing vehicle.)

* The LED control unit does not generate a load supplement in the event of a hazard warning light flashing. This must also be taken into account.

Solution 2: LED flasher unit

Failure control and electrical connection

PRODUCT FEATURES

- For controlling direction indicators in accordance with ISO 13207-1
- For vehicles with 12 V and 24 V vehicle electrical system voltage
- Any combination of bulbs and ISO LED lamps possible
- Suitable for additional operation of trailer direction indicators
- Pin diagram compatible with ISO 7588-2

APPLICATION

Control function: The failure of a direction indicator in a motor vehicle or trailer has to be shown to the driver either acoustically or by means of warning indicator lamps. HELLA flasher units ensure such control by means of the following:

1. Doubling of the flashing frequency (e-controller) or
2. Control lamp switch-off system (p-control).

DESIGN AND FUNCTION

LED direction indicators conforming to ISO 13207 can "communicate" with the flasher unit. The flasher unit checks a firmly defined energy requirement at a firmly defined time: Exactly 21 W from 100 – 130 ms after each time the direction indicator is switched on. The energy requirement or "pulse" corresponds to that of a bulb in this case, meaning that the flasher unit notices no difference between a bulb and an LED lamp that conforms to ISO 13207.

The advantage: Bulbs and ISO LED lamps can be operated in any combination on a flasher unit that conforms to ISO 13207. This is relevant both for vehicles that are frequently operated with different trailers and also for manufacturers who wish to offer several variants of the lighting system without having to modify the underlying electronics.

Solution 3: Simulation device for cold check with LED lamps

Failure control and electrical connection

PRODUCT FEATURES

- For individual function monitoring of LED direction indicators compatible with ISO standard 13207-1
- Storage and transmission of the last function status of the LED direction indicator to the central control unit
- For vehicles with 12 V and 24 V vehicle electrical system voltage
- Pin diagram compatible with ISO 7588-2

APPLICATION

If the existing vehicle electrical system is programmed to monitor the lighting even when it is not in operation, this is referred to as a cold check. During a cold check, a small test pulse is transmitted to the lamp while it is switched off to see whether this pulse is discharged via the bulb to ground. The energy here is so low that the bulb does not light up.

As LED lamps are essentially not suitable for this form of monitoring, HELLA offers an electronic system for "simulation of the cold check" in order to ensure operation.

DESIGN AND FUNCTION

The control unit for cold checking is connected between the central control unit and an ISO 13207-compliant LED direction indicator.

The cold check control unit checks the function of the direction indicator during operation using the ISO pulse. If the direction indicator fails, the device saves the last status, which means this can then be displayed during the next cold check.

----------------	-----------------	-----------------

Solution 4: LED lamp control unit

Failure control and electrical connection

PRODUCT FEATURES

- To monitor the function of the light functions
- Only one control unit is required for both sides (right and left).
- The DEUTSCH connector, itself integrated in the housing, enables easy integration in the vehicle architecture
- Active thermal management including overheating protection to ensure a long lifetime
- Completely watertight and dustproof for maximum functioning safety
- Electromagnetic compatibility (EMC) for trouble-free use of, for example, radio
- In the event of a hazard warning light starting to flash, the simulation is switched off

HELLA offers two different types of LED lamp control units designed to monitor light functions:

- Basic version: Monitors only the direction indicators
- Premium version: this monitors all lighting functions

Configuration example with ISO pulse

In accordance with ISO 13207

LED lighting Failure control and electrical connection Control unit for current monitoring

PRODUCT FEATURES

- For individual function monitoring of LED headlamps and beacons
- Failure indication via status output
- For vehicles with 12 V and 24 V vehicle electrical system voltage
- Pin diagram compatible with ISO 7588-2

APPLICATION

In order to test LED low beam headlamps or LED beacons, the average energy consumption is determined by measuring the current. The current monitors are matched to the HELLA products and enable very reliable monitoring.

5DS 011 630-011	24 V

BLOCK DIAGRAM

DESIGN AND FUNCTION

The control unit is connected upstream of the LED headlamp and continuously measures the current consumption in the switched-on state. If a minimum current value is exceeded, the correct function of the headlamp is displayed by a high level at the status output. If it is undershot, the defect of the headlamp is displayed by a low level. Monitoring is only carried out when the ignition and lighting function are on.

The adjacent control unit can be used for current monitoring (direct measurement) of the main light function in the following examples of our module headlamps:

Control unit for side marker lamps
Optional for towing vehicle with trailer, in connection with the operating of an LED flasher unit

In order to increase the safety of trailers, the side marker lamps can flash synchronously with the direction indicators.

PRODUCT FEATURES

The control unit monitors functioning of the rear direction indicator. In the event of any fault, it switches off the flasher function of the side marker lamps to ensure that the failure control of the towing vehicle conforms to the law.

- Only one control unit is required
- The compact design enables mounting in a distribution box
- Very robust and waterproof thanks to full encapsulation
- High EMC protection for use in very challenging environments
- Suitable for use with all LED side marker lamps

TECHNICAL DATA

Operating temperature	-40°C to +65 °C
Degree of protection	IP 6K9K
Contacting	Flat connector DIN 46244 A6, 3 x 0.8

This control unit can be connected to any side marker lamp and allows it to flash, if necessary.

PIN ASSIGNMENT/ELECTRICAL CONNECTION

- Pin 1 Output: Left side marker
- Pin 2 Output: Left direction indicator light
- Pin 3 Output: Right side marker
- Pin 4 Output: Right direction indicator light
- Pin 5 Input: Left tail light
- Pin 6 Input: Left direction indicator light
- Pin 7 Ground
- Pin 8 Input: Right tail light
- Pin 9 Input: Right direction indicator light

CONTROL UNIT FOR FLASHING SIDE MARKER LAMPS	PU*
ECE R48 Category 6, 24 V	5DS 223 544-001 1

* Packaging unit

ECE-R48 REVISION 6

Mandatory: The vehicle must be equipped with a side direction indicator light.

Option 1: Direction indicators of the CAT 5 approval class are operated on vehicles with side marker lamps.

OR

Option 2: The existing side marker lamps on the vehicle are switched on/off together with the direction indicator. The existing side marker lamps are switched on and off together (in phase) to indicate the direction of travel, i.e. all side marker lamps on one side must flash (the exception is combination lamps such as rubber arm lamps). All amber lamps take over the flasher function synchronously.

FAILURE CONTROL

If the side marker lamps flash together (in phase) with the rear direction indicator, they obtain their energy from the same supply line. This can lead to a situation where, in the event of a defect in the rear direction indicator, the failure monitor system installed in the towing vehicle no longer functions in accordance with the law and therefore cannot detect a failure. The driver electronics developed by HELLA will ensure the necessary safety. And any defect in the rear direction indicator is reliably detected so that the towing vehicle can inform the driver.

Rocker switches
A choice of 3 different series

PRODUCT FEATURES

Rocker switch:

- Modular structure covering individual applications right up to complete vehicle equipment
- Multifaceted applications
- High degree of coverage as regards standard functions
- Clear allocation of switch functions, even under extreme conditions
- Timeless design
- High abrasion resistance of lasered symbols
- Replacement and retrofitting via standardised mounting hole and mounting frame

APPLICATION

The HELLA rocker switch range, which boasts three series, offers the right configuration for every application thanks to its wide range of functions and countless symbols.

4570/7832 series: Basic range of simple electrical systems that has proven its worth for more than 20 years. The snap-in symbol discs are available in accordance with DIN or in the customer's choice of colours. The symbols are lit by bulbs or LEDs, which can be ordered as accessories. Replacement and retrofitting are possible by means of standardised mounting holes and mounting frames.

The 3100 series – for robust and waterproof applications: It meets the requirements of protection class IP 68 (dustproof and waterproof). The series is ideal for use in agricultural and construction vehicles because of its high degree of reliability under extreme conditions. And an added bonus: it is simple to install either directly in the mounting hole or using a modular mounting frame. Choose from a wide variety of standard and customer-specific symbols. These abrasion-resistant, lasered symbols are illuminated by integrated LEDs.

Series 4100 for interior applications and secure switching for small currents: The modular switch series with self-cleaning micro switch is suitable for modern electrical and electronic systems. This ensures reliable switching even of small currents without contamination of the contacts occurring. The series stands out from the crowd with its timeless design. Its abrasion-resistant, lasered symbols are illuminated by integrated LEDs. A wide range of standard and customer-specific symbols is also on offer for this series.

DESIGN AND FUNCTION

The switches are modular and can be individually configured to suit customer requirements – starting with a single application right through to complete vehicle equipment. The following designs are available: On/off switch (0-I), changeover switch (0-I-II, I-0-II), warning light switch, locking switch.

In addition to a large selection of switches and functions, we offer individualised and abrasion-resistant laser marking in addition to the standard characters. Customers can thus select their own personalised symbols themselves. Always included: High HELLA quality.

Safe switching is guaranteed even under difficult conditions. This is ensured by means of precise feedback, unambiguous symbols and the integrated orientation and function lighting. A disable mode is also available as an option.

The rocker switches are mounted as snap-on fixtures on a pre-determined installation opening either directly or using an installation frame. In addition to individual frames, modular intermediate and end pieces that can be combined together are available, which means that switch rows can be created. Matching mating connectors, warning lamps and dismantling tools round off the range of accessories.

Reversing and warning alarm BM10 and BM30

PRODUCT FEATURES

- Penetrating, long-range alarm sound
- Housing of glass-fibre reinforced nylon with integrated mounting bracket (BM30)
- Insulated electronics encapsulated with epoxy resin to protect against rust, moisture/humidity and vibration
- Various options for sound pressure level suitable for town traffic and construction environments
- Optionally available with automatic adjustment to environments with changing sound levels

TECHNICAL DATA	
Rated voltage	12–48 V
Frequency range	700 – 2,800 Hz
Sound pressure level at 1.2 m distance	Fixed/automatic adjustment (see table)
Power consumption	12 W
Current consumption	max. 0.6 A
Operating temperature	-40°C to +85 °C
Degree of protection	IP 67
Lifetime	100 hours (SAE J994)
Housing material	BM10: ABS BM30: Glass-fibre reinforced nylon
Type approval	ECE-R10 SAE J994

APPLICATION

The reversing alarm is an indispensable feature in hazardous working environments. The high-frequency alarm can actively prevent accidents. It gives commercial vehicles additional safety when they have to manoeuvre and reverse.

In some countries, installing a reversing alarm is mandatory for vehicles with limited rearward visibility. It is obligatory for the vehicle to be fitted with an audible reversing alarm that is louder than the ambient noise. Many of the regulations require a sound level higher than 90 dB.

DESIGN AND FUNCTION

The reversing alarm emits a warning sound as soon as reverse gear is engaged. In this way, it warns other road users about the vehicle backing up.

Warning alarms are available with various volumes depending on the application. So, for example, reversing alarms with a signal volume of approx. 90 dB are used in city traffic while warning alarms with a volume of more than 100 dB are found on construction sites where ambient noise is very high. A reversing alarm that is just 3 dB louder than another has twice the volume.

Dual-glass mirror for agricultural and construction vehicles

PRODUCT FEATURES

- Standardised mirror, manually adjustable or electrically adjustable and electrically heated
- Main and wide angle mirror in one housing
- Housing made of PP material
- Glass in optimised size in accordance with ISO 5721-2 and ECE R46
- Side-specific positioning of the wide-angle segment for a larger and optimised field of view

DESIGN AND FUNCTION

This dual-glass mirror provides greater safety for the driver during daily work and in traffic. The mirror has a maximised curvature with a glass radius of 1,260 or 310 mm, which is fully utilised to increase the driver's indirect field of vision. At the same time, its intelligent and compact design improves the driver's direct view when in traffic or in the work environment. No metal components are used, so the risk of corrosion is avoided and also a low weight is achieved.

APPLICATION

The mirror is suitable for a wide range of vehicles, such as construction equipment, telehandlers, front loaders, tractors, sprayers, combine harvesters and other special vehicles.

It is very versatile and offers a convincing solution for the increasing demands of the daily work routine found on construction sites and in the agricultural sector.

TECHNICAL DATA	
Operating voltage	12 V
Surface mounting	Vertical and horizontal, manually or electrically adjustable
Support rod	Ø 18 to 24 mm
Housing	PP housing with high UV stability
Size	424 x 191 mm
Curvature radius of main mirror glass	1,260 mm
Curvature radius of wide angle mirror glass	310 mm
Mounting	Preassembled screws for easy mounting

Mirrors for agricultural and construction vehicles

PRODUCT FEATURES

- Vertical and horizontal mounting on mirror arm possible
- Wide adjustment range in x and y positions and also rotatable around the z axis, for an optimal view
- Surface of chromium-plated glass with highest degree of corrosion resistance
- Reduced weight and optimised ergonomics thanks to slim housing and minimised frame
- Modern, aerodynamic styling in line with today's vehicle designs

DESIGN AND FUNCTION

This mirror provides greater safety for the driver during daily work and in traffic. It has a maximised curvature with a glass radius of 1,400 mm, which is fully utilised, therefore increasing the driver's indirect field of vision. Because of its compact design, it improves the driver's direct view in traffic and in work situations. In case of an emergency, it can be folded away.

APPLICATION

The mirror is suitable for a wide range of vehicles, such as construction machinery, telehandlers, front loaders, tractors, sprayers, combine harvesters and special vehicles.

It is very versatile and offers a convincing solution for the increasing demands of the daily work routine found on construction sites and in the agricultural sector.

Trailer connection devices 24 V / 12 V

PRODUCT FEATURES

- Power transmission from 24 V to 12 V voltage systems
- Power supply for 12 V lighting
- Uncomplicated integration without data interface

APPLICATION

Allows the use of 12 V trailers on vehicles with 24 V operating voltage.

DESIGN AND FUNCTION

The trailer connection unit has 7 channels for the trailer lamp function. The series indicator lamp indicates if the 12 V trailer's direction indicator has malfunctioned.

Known vehicle limitations: not for Mercedes-Benz Atego model series MP2, not for DAF 75.360 CF. Vehicle applications between towing vehicle and trailer must be checked before permanent installation with 24 V connector and 12 V coupling; especially for towing vehicles equipped with a bulb monitor.

TECHNICAL DATA	
Rated voltage	24 V / 12 V
Power per switching channel	2x 21 W
Power per direction indicator	21 W
Operating temperature	-30°C to +80°C
Polarity reversal protection	Permanently polarity-reversal protected
Degree of protection	IP 5K9K in accordance with DIN 50021-55
Type approvals	e1 / CE
Idle current	8 mA
Control current of the switching channels	2.5 mA
Voltage loss of the switching channels	200 mV

PIN ASSIGNMENT/ELECTRICAL CONNECTION 5DS 008 125-011

PIN ASSIGNMENT/ELECTRICAL CONNECTION 5DS 008 125-001

PROGRAM OVERVIEW

Voltage range	Variants	Part number	PU*
24 V / 12 V	With integrated voltage converter; operation possible without a separate charge compensation device	5DS 008 125-011	1
24 V / 12 V	Separate charge compensation device or a separate voltage converter with 8 A 12 V required**	5DS 008 125-001	1

* Packaging unit

** The following devices can be used for this purpose: 8ES 008 123-001, 8ES 008 124-001 or 8ES 006 658-021

Fans

PRODUCT FEATURES

- Airflow can be adjusted using a two-position switch
- Can be swivelled to all sides and fixed in any position
- Propeller shielded by a guard
- 150 mm propeller
- Lateral, upright or pendant mounting possible

TECHNICAL DATA

Connecting cable	1,400 mm
Air flow rate	Stage 1: 70 l per second Stage 2: 95 l per second
Power consumption	6.5 W

APPLICATION

The task of a fan is to move air around in a room. Fans are being used more and more frequently and make everyday life or work more bearable, even on the particularly hot days of the year. The moving air automatically creates a cooling sensation for human beings.

DESIGN AND FUNCTION

The fan operates by pressing air from back to front, which in turn leads to air circulation.

In this way, the cool air can be optimally distributed throughout the room, which means that fans are used especially on warm summer days.

Intelligent battery sensors

PRODUCT FEATURES

- Accurate measurement of battery condition parameters: voltage, current and temperature
- Determining battery condition parameters i.e. state of charge (SOC), state of health and state of function (SOF)
- Simple electrical and mechanical integration

APPLICATION

The intelligent battery sensor from HELLA (IBS) is the key element in vehicle energy management.

The IBS reliably and accurately measures the battery parameters of voltage, current, and temperature. Information on the state of charge (SoC), the state of ageing (SoH) and also on the anticipated starting capability (SoF) of the battery is calculated algorithmically using the measured values. The IBS is designed to be used in starter, gel and AGM batteries to monitor in-vehicle starter or consumer batteries. And the IBS can be directly integrated into the vehicle electrical system via the standardised LIN protocol.

DESIGN AND FUNCTION

The IBS is attached directly to the negative pole of the battery via the pole terminal (4).

In addition to the terminal, the mechanical part of the battery sensor consists of the shunt (1) and earthing bolt (5) components. The shunt is attached to the vehicle's load path and serves as a measuring resistor for the purpose of indirect current measurement. The existing ground cable can be conveniently attached to the earthing bolt (5), e.g. with the optionally available battery pole adapter.

The electronics are located in a moulded housing (3) with a plug connector (2) functioning as an interface to the energy management system. The LIN protocol is the communication interface to the higher level control unit. The supply voltage, used simultaneously as the reference voltage for voltage measurement, is provided by the connection to the positive pole of the battery.

The ASIC is the main electronics component used to record and process measured values. Measured value acquisition, i.e. data logging in the ASIC, as a precision sensor, is the core function of the intelligent battery sensor and is used to record the physical parameters of current, voltage and temperature.

PROGRAM OVERVIEW

Four intelligent battery sensor variants are available. Sensor 1 is the basic version. Sensor 2 is used to monitor a second battery in the same communication network. The third variant is used when two 12 V batteries are series-connected (24 V vehicle electrical system). The fourth variant is intended for vehicles with high starting currents (e.g. agricultural and construction machinery) and for those with higher ground cable cross-sections (> 70 mm²).

Operating voltage	Type	Mating connector	Part number	PU*	Page
7.5 – 32 V	Cable lug, straight	Hirschmann 872-858-546	6PK 011 700-001/-007	1/100	149
7.5 – 32 V	Cable lug, right-angled	Hirschmann 872-858-546	6PK 011 700-311/-317	1/100	150
6 – 18 V	12 V, IBS Global	Hirschmann 872-857-565	6PK 013 824-001/-007	1/100	151

BATTERY CONDITION ALGORITHMS

The intelligent battery sensor calculates and monitors the following battery conditions

State of Charge:

The state of charge (SoC) describes the current state of charge of the battery.

The SoC is defined as:

SoC [%] = dischargeable capacity / nominal capacity

State of Health:

The state of health (SoH) indicates the battery's ageing condition.

The State of health (SoH) is defined as:

SoH [%] = available capacity / nominal capacity

The available capacity of the battery typically decreases with increasing battery age and after a long and useful service life.

State of Function:

The state of function (SoF) describes the future starting capability of the engine based on the power currently measured and on the voltage

TECHNICAL DATA

Operating voltage	7.5 – 32 V
Polarity reversal voltage	-28 V / 60 s
Test voltage	27.8 – 28.2 V
Operating current ¹⁾	≤ 16 mA (normal mode)
Idle current ¹⁾	≤ 230 µA (sleep mode)
Nominal resistance (shunt)	68 µΩ
Permanent load current ²⁾	± 200 A
Maximum current ²⁾	± 2,000 A (20 ms)
Operating temperature	-40°C to +80 °C
Re-heating temperature	+105 °C to +120 °C
Storage temperature	-20 °C to +50 °C
Defined charge controller	36 V / 120 min
Jump start	48 V / 2 min
Load Dump	58 V / 500 ms
Output signal	LIN 2.0 or higher
Degree of protection	IP 6K9K
Permissible pole terminal tightening torque	5 Nm ± 1 Nm
Thread for ground connection bolt	M8
Weight	119 g
Max. Battery capacity ³⁾	255 Ah
Mating connector ⁴⁾	872-858-546

¹⁾ Condition: T_a ≤ 40 °C; U_{bg} = 24 V; U_{brun} = 28 V

²⁾ Typical condition: T_a ≤ 80 °C; U_b = 24 V
Ground cable typical: ≥ 70 mm²
Approved for max. 500 ms.

Other configurations on request.

³⁾ Expandable on request.

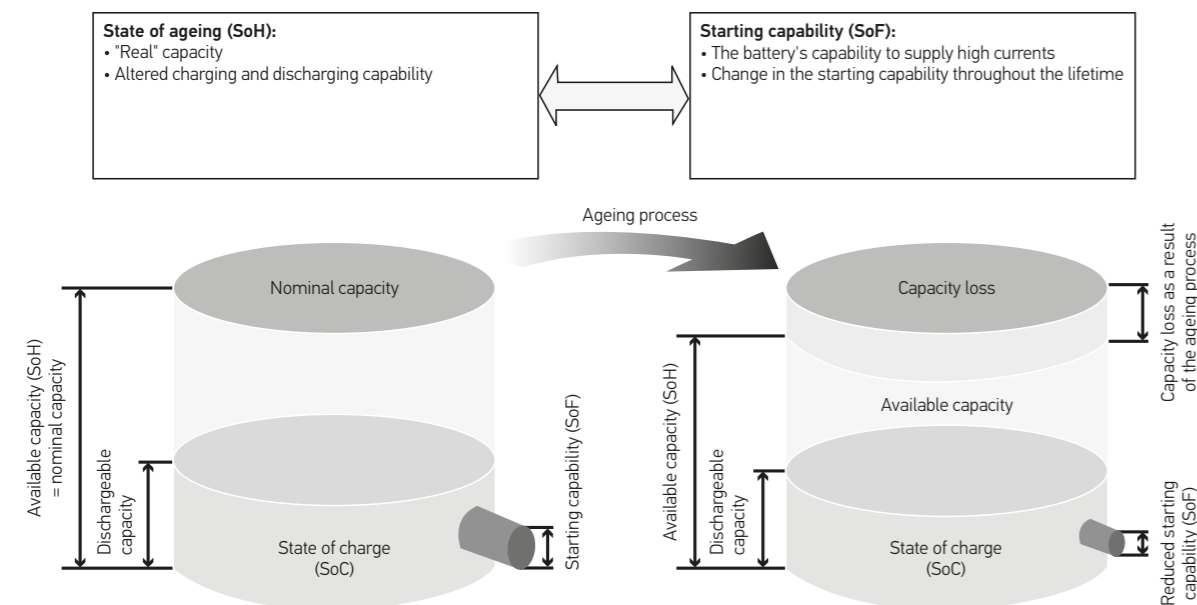

⁴⁾ This accessory is not included in the scope of delivery.
Available from Hirschmann Automotive.

PIN ASSIGNMENT/ELECTRICAL CONNECTION

Pin 1: Connection for LIN bus
Pin 2: Connection for B+

DESCRIPTION

Optimal energy management for cars, EVs, agricultural machinery, last-mile vehicles, marine applications and motorhomes. Compared to previous IBS generations, the IBS Generation II offers the following benefits: The sensor can now also monitor larger batteries. Thanks to the higher and adjustable nominal capacity, this battery sensor can also be used to monitor several series-connected batteries. Instead of 250 ampere hours, it can be configured for up to 500 ampere hours (Ah). This is particularly important in view of the growing energy requirements of motorhomes and caravans. In addition, these new IBS Generation II units are particularly robust and can also reliably detect short-term, high current consumption – for example when bow thrusters are used. The design has been optimised in such a way that installation even in locations with difficult access, e.g. under a seat, is easily possible. Furthermore, this product variant has the latest algorithms for battery condition detection. Reliable statements on charge condition and ageing are therefore possible even with higher idle currents such as can occur, for example, in motor homes.

DC/DC voltage stabilisers 200 W/400 W

PRODUCT FEATURES

- For 12 V systems
- Output power 200 or 400 W
- System stabiliser with temporary voltage drop

DESIGN AND FUNCTION

The voltage stabiliser is activated when the ignition is switched on. When stabilisation is not required, the subsystem of the vehicle electric system is coupled with the main system via a low-impedance cable.

The voltage drop at engine start up is indicated by the start signal. As a result, the subsystem and the mains are decoupled from each other and stabilisation is carried out.

The device can also be equipped with a LIN diagnostic interface (optional).

APPLICATION

The DC/DC converter is also referred to as a voltage stabiliser. In the event of a brief voltage drop (when the engine starts), it maintains the output voltage to the electric subsystem (e.g. with the start/stop system).

This primarily concerns the elements of the vehicle electrical system that are perceived by the driver but which are not critical from a safety perspective. These include, for example, the radio and navigation systems (infotainment systems), but also various terminals (e.g. for agricultural and construction vehicles) and information systems (e.g. in buses).

FUNCTIONAL DIAGRAM

The voltage stabiliser is logically connected between the power supply of the vehicle electrical system and the (sub) vehicle electrical system to be stabilised. Stabilisation is activated as soon as the start information from the starter (terminal 50) is available. Stabilisation (boost mode) is limited to 5 seconds.

DC/DC converter 24 V/12 V

PRODUCT FEATURES

- Power transmission from 24 V to 12 V voltage systems up to 300 W
- Passive air cooling
- Power supply for 12 V loads such as lighting, ECUs, sensors etc.
- Uncomplicated integration without data interface
- Built-in protection from short circuits and polarity reversal
- Efficiency of up to 90%

APPLICATION

This 24 V/12 V converter enables 12 V loads to be used in a 24 V based E/E architecture. The DC/DC converter is designed to supply power to conventional 12 V loads such as fans, lamps and also navigation and infotainment systems.

DESIGN AND FUNCTION

The 24 V/12 V converter is a state-of-the-art switched-mode power supply that uses highly reliable components suitable for automotive manufacturing. It can accept wide-range input voltages from 18 V to 32 V and delivers stable output power at 13.5 V and up to 20 A rated current. Integration into the vehicle E/E architecture is made as simple as possible since no data interface is required. So as to reduce electromagnetic noise and interference, it uses spread spectrum techniques for the driving of MOSFETs. Protection against polarity reversal of input supply, output short-circuit and also of over-voltage and over-current etc. is integrated. Passive air cooling ensures extremely low maintenance. The converter is designed for use inside the cabin (IP 30).

TECHNICAL DATA

Operating temperature	-40°C to +85 °C
Working temperature	-40°C to +75 °C
PWM centre frequency	200 kHz (with dithering)
Max. Power	Up to 300 W
Input voltage	18–32 V
Output voltage	13.5 V
Rippel	< 200 mV _{pp}
Idling current	< 5 mA
Functional safety	QM
Data connection	N/A
Efficiency	Up to 90%
Dimensions	115.5 mm (L) x 105.5 mm (W) x 41.4 mm (H) without mounting bracket
Weight	Approx. 600 g
Connector	6-pin connector strip (Tyco), 90° Nr. 9-966140-5
Mating connector*	Nr. 8-968970-02
Cooling concept	Air, passive
Degree of protection	IP 30
